Continuation of 3. NOTE: claims 22-27 are newly presented. The issue of the wavelengths or spectral region of the light used in the exposure is newly presented..

Continuation of 11. does NOT place the application in condition for allowance because: The examiner notes that the exposure process of Tuberfield et al take place at room temperature and the medium is then heated to liberate the acid and induce polymerization. The examiner notes that the EPON-SU-8 is the same epoxy resin described as useful in section [0039] of the prepub of the instant application. The sulfonium salt is an onium salt, the same class as the iodnium salts described in section [0043] of the prepub of the instant specification. Room temerature is below the temperature of 65 degree C recited in the applicants specification at [0044] of the prepub. The applicant has misinterpreted the text of Cambell, which merely indicatesd that the refractive index does not change during short duration exposure and cause blurring/distortion of the pattern. The meaning of the claims is based upon the applicant's own specification, which dominates any other teachings. The positions argued conflict directly with the teachings of the specification. The rejections stand.
